FAKE NEWS Reality Warping #whistleblower
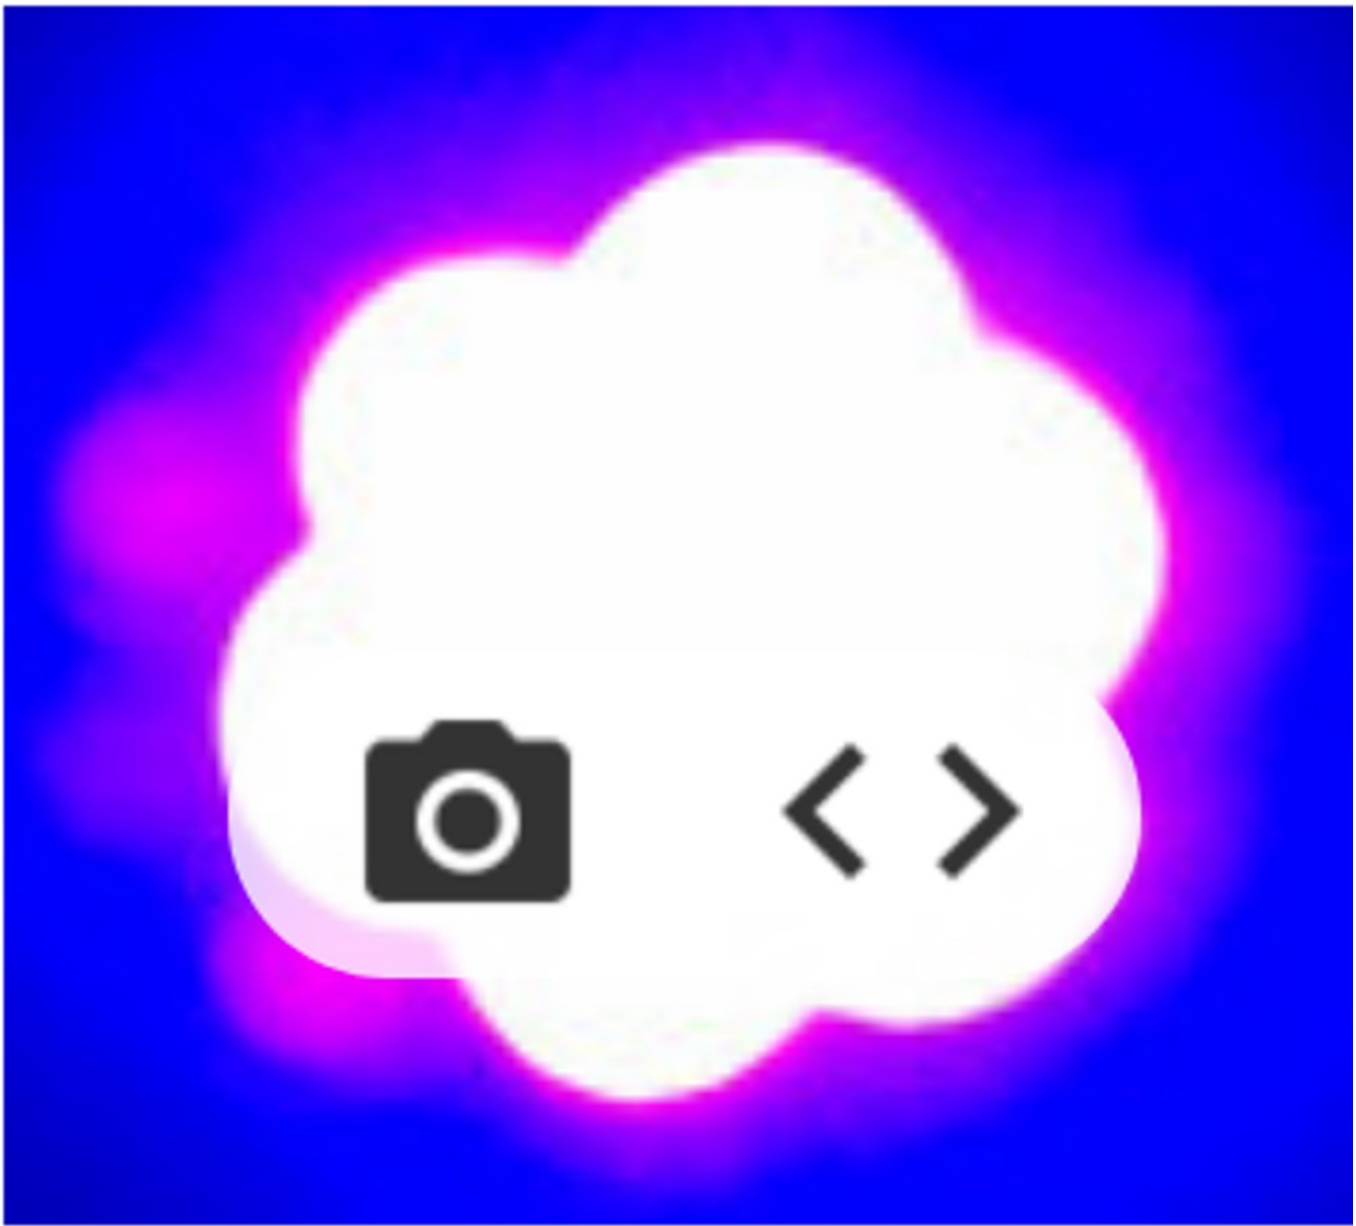

Dick Tripover • August 16, 2018

- Most importantly, the political mind numbing of the people via the injection of FAKE NEWS which was simply a seed to sew uncertainty into every

single statement you ever hear, They want you to be forever skeptical, optimism is not preferred.

The injection of Fake News in our culture took some time to cultivate, but not long. Reporters, and Main stream outlets walked right into their own demise by following scripts written for them without speaking their voice (not to say that some didn't) For a while Fake News worked in our favor, but the opposition is not stupid; never underestimate your opponent. So we fast forward to the injection of Fake News Squared; Fake News became so saturated throughout the MSM, the independent media, and tabloids, that we somehow got to a point where we as Americans read something and say " Yah … Ok…"

At first Fake News was meant to show how the MSM was misusing public trust to feed narratives to the American People that were not in sync with reality. This caused the right, and "alt-right" to then question their own sources as the scourge of "Fake News" became rampant. Now we live in a world where each individual has to parse through multiple news sources before they find one that fits with the way they feel, and even then, they have to hear other outlets talk about how they are the most trusted outlet in News.

Fake News ended up being a double edged sword. It allowed us to shine line on the Democratic mishandling of the election in 2016, and it allowed us to see past the mind tricks of Obama, and Hillary Clinton (even though the list is much longer than just them) It allowed us to see past through the social pressure and Facebook conditioning to say "No! We will vote for this man", but on the other side of the coin, its lead to a political climate of uncertainty; and in times of uncertainty, loyalty is a fluid thing.

As for the people, most don't know whats up from down. They see the president give addresses, and they hear about new legislation but they have no idea what goes on everyday; the struggle to keep America in America's hands. Fake News has turned the voting population into people who know are so fed up with lies, they don't even want to spare time to read the truth; there comes a point where someone is lied to so many times, that even the truth is not recompense enough. So we have the media organizations in chaos, trying to seem as reputable as they can, you have the people who are stuck in fake news limbo, not knowing exactly whats true and whats false, but holding on to hope, and you have the President, who has successfully used Fake News to shed light on the corrupt MSM and establishment; but at the same time the opposition uses this idea of Fake News to launch attacks on the President that have to

basis in fact. This is the world we find ourself in, one of speculation without proof, one with a hunch, not sources one of the STORY, over the truth (Not to mention the many outlets and newspapers that make it their business to manufacture negative stories about Mr Trump).

-The boosting of ego via a multitude of bots infiltrating your daily live creating a family of controlled friends, even tho those friends are being somewhat controlled.

Now we move to the abstract. Do you use Discord? What about steam? Do you play

EVE? Have you ever talked with a chatbot; maybe cleverbot for instance? If the answer is no, than i am genuinely surprised, but theres always exceptions. Who are you talking to on the other end of that mic? Do you know? Do you even ask? Is it even important really? I mean you guys are doing something, having fun, talking, what does it really matter if someone wants to use an avatar right? Well what if one person was 6 people; what then? Lets say i make 6 discord accounts and join multiple channels. As crazy as it may sound it would put me at quite an advantage. When speaking to someone we ask a question and get an answer, thats how a conversation works. Now lets say i have 2 bots in the same chat room, i start talking to myself via the 3 bots and someone else joins in. Do you see how things have changed? Instead of a one of one interaction there are now variables. Person A said this leading to the response by person B, Ohh its my turn, what did person A say, and person B, Ohh i c, ok (input) <— Do you see the change in thought? It forces you to think higher dimensionally, kind of like doing 2 things at once but on a bigger scale.
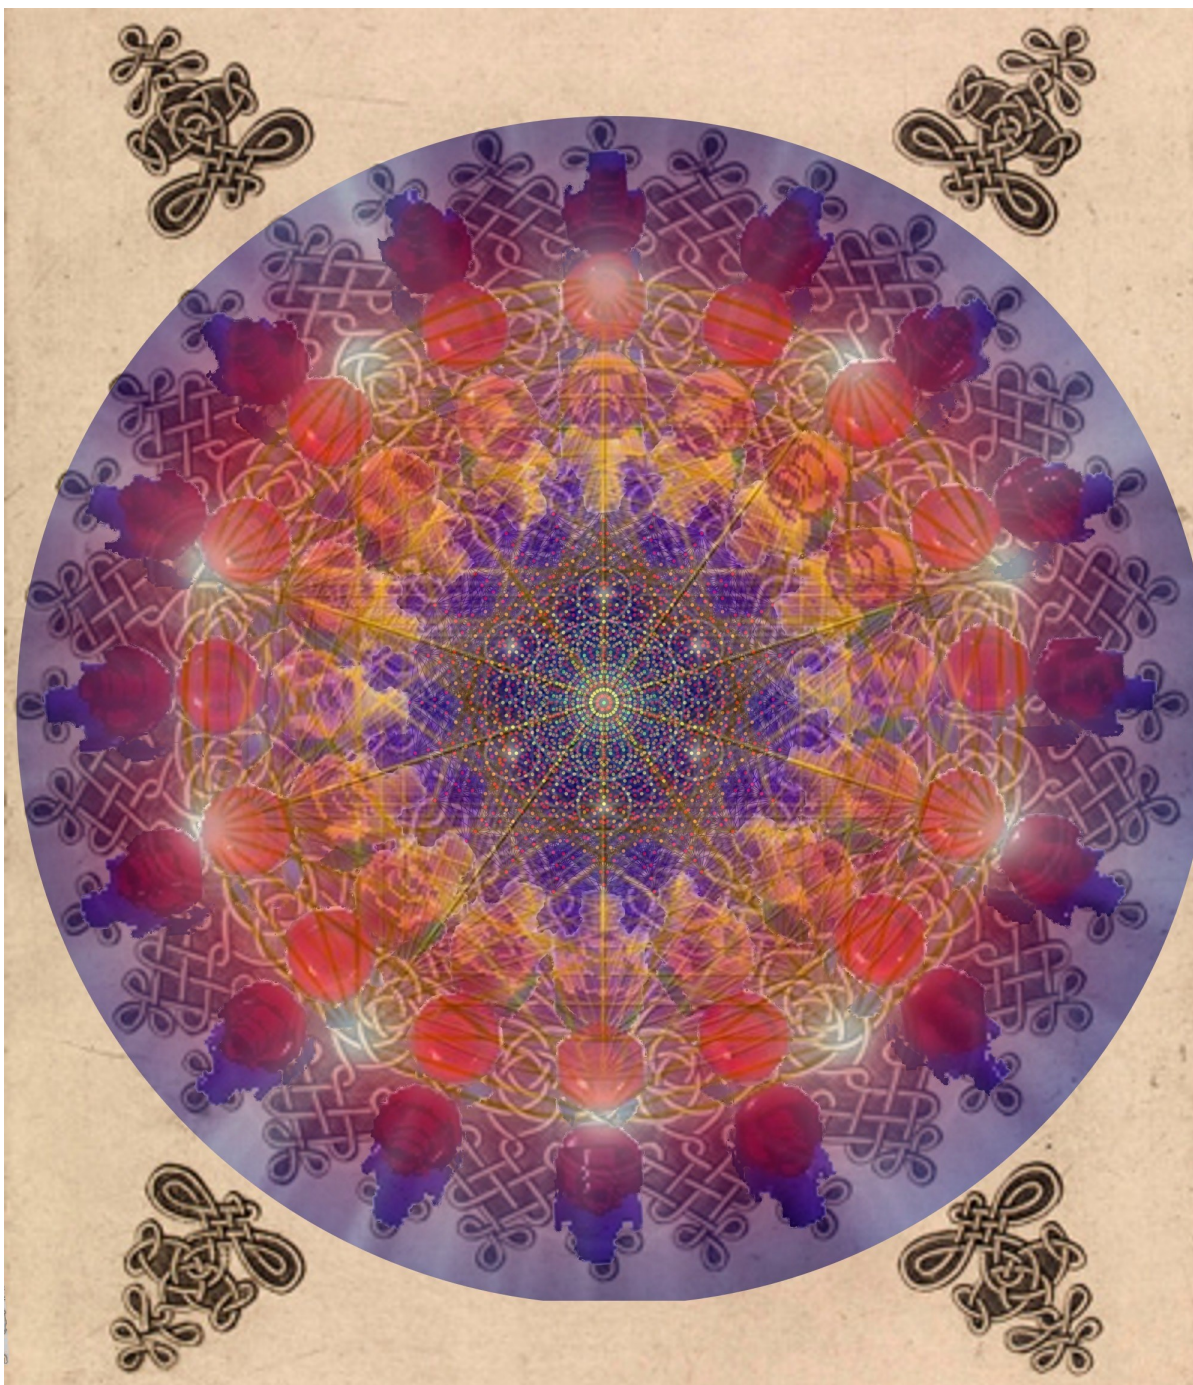

This is coming more and more prevalent amongst websites that allow for multiple accounts. For reasons of deduction, comfort, and others, people are using multiple accounts to effect one person, using multiple personalities. Yes, this is the age we live in, these are the threats we face.

- The prediction factor of your individual existence; let me explain. You are on Facebook, twitter, Instagram, each app with metadata and stored personal information. This information is then used to cross check against your purchases, tv history, commercials that you spend the most time watching, etc; the point obviously to get you to spend money but there is a bigger aspect. When it comes to something

like Facebook we are referring to a web of sorts. One person, is worth a million bucks is a phrase i like to use. One person has x friends, that person has x friends, minus mutual friends,,, etc it is endless, so understand that your individual use, is in fact the grease that keeps the machine of Facebook running. The exponential runoff of likes and loves.

The D Wave One, was the first quantum computer built in 2007. Why do i bring this up? Well, when talking about the prediction factor its important to know not only how they collect your data, but what they then do with it. Quantum computing opens

up a world of endless algorithms and simulations, some of those simulations involve your information, your location, stores in your area, Dwave affiliates, your most commonly browsed sites, your gmail contacts, and much more. They use this information to cross reference what it is that makes you you!. Down to the nuts and bolts; they know your schedule, when you work, when you eat, when you like to online shop, where your favorite coffee shop it, what music you want to play based on your past selections; its an intrusion of privacy so extreme, we don't even see it occurring.

We allow our children to make profiles on Facebook and other social media sites when we have seen the results. Any scientific experiment works the same way; if you were to take Facebook, and hold it up, i do not believe it would be a success for our culture. Yes it has brought us together, yes it has allowed us to share our passions with those around us; but underneath all the good was the bad. The collection of our data, the selling of our data to 3rd parties, the bias thats injected when dealing with Facebook ads, and other promotional tools. When i was growing up Myspace had just come out, say what you will, but we used that as kids to just have fun, it was different in a lot of its functions; but as anything else, things change. The point here is you may have 500 friends, 200 of whom have 2000 friends, Those 2000 friends than see you in mutual and the circle grows, After a while, you end up with thousands of "friends" you've never met before. Also understand, people are smart with computers. DUH, lol, it is possible to use a bot to run a Facebook page, once you understand that you may think twice next time you get a friend request from a girl in a bikini with one picture and no profile history.
